

Claims

1. A connector, whereof a portion of the housing protrudes, and wherefor an electrical connection and mechanical fixation is achieved by said protruding portion
5 being housed within a recessed portion of an opposing connector, characterized by:
the housing having a fixing portion fixed to a board, and a movable said protruding portion;
said protruding portion being supported by the housing fixing portion via contact portions; and
10 said protruding portion having stoppers that come into contact with the contact portions thereby stopping said protruding portion when the connector is inserted.
2. A connector, whereof a portion of the housing protrudes, and wherefor an electrical connection and mechanical fixation is achieved by said protruding portion
15 being housed within a recessed portion of an opposing connector, characterized by:
the housing having a fixing portion fixed to a board and a movable said protruding portion;
said protruding portion being supported by the fixing portion of the
20 housing via contact portions; and
said contact portions having stoppers that come into contact with the housing thereby stopping said protruding portion when the connector is removed.
3. A connector recited in either one of Claims 1 or 2, characterized in that the
25 contact portions are exposed on one surface or both surfaces of the protruding portion, and have touching portions that electrically connect to an opposing connector.
4. A connector recited in any one of Claims 1 through 3, characterized in that the
30 contact portions are aligned in a zigzag manner.
